MailStore Server is an affordable solution that allows you to centrally manage email archives that are hosted on IMAP and SMTP servers and displayed in standard Windows clients. It is easy-to-use and supports remote management. Besides, it includes compliance features, so you can easily adjust it to your needs. It's ideal for medium size businesses with average tech skills. Note: MailStore Server is not fully compatible with Windows Server 2016 and Windows 10. Criticism Although it is one of the most popular mail archiving tools, the program is criticized for its high licensing fees (\$189/license) and the inability to access the Microsoft Exchange 2003 database. MailStore Server allows you to create a copy of all emails in a central archive. It includes support for exporting options and fast searches. Intuitive layout The program excels in the visual department. It provides a well-crafted GUI that is divided into two main smart panels: one is used for accessing the archive tools, while the other comprises the necessary features for bringing each task to an end. The Start Page is the place where you activate several functions (archive, search and export email) and administrative tools. Additionally, it integrates a Dashboard that offers detailed information about the server (e.g. name, OS, processor/memory, version), archive (e.g. total size and disk size, number of archive stores), compliance (e.g. enabled or disabled retention policies, auditing and email preview by admin) and currently logged on users. Archive profiles The program makes use of archive profiles that embed data from a specific mail server, specified mailboxes or a custom folder within a mailbox, and additionally settings such as deletion rules. You can manually run an archive or schedule it, modify or delete it, as well as associate specific users with corresponding archives. Users can archive individual mailboxes, local email client profiles and email items, while administrators are given the power to grant user permissions and centralize an archive mail for several or all users. Create a new profile MailStore Server allows you to define a new profile by selecting between one of the supported servers (Microsoft Exchange, Google Mail, IceWarp Server, Kerio Connect or other IMAP/POP3 server), clients (Microsoft Outlook, Windows Mail, Windows Live Mail, Thunderbird, SeaMonkey) and files (EML, MSG, PST and MBOX file format). For each of the aforementioned supported servers, clients and files, the tool employs wizards for helping you set up authentication parameters and additional settings. Searches, exporting options and recent results A smart search option is implemented for looking throughout an admin's archive, while the exporting feature is useful when you want to save emails directly into server mailboxes or to the file system as individual items (EML or MSG file format). The utility records information about the previous archives and export results in a dedicated panel, and lets you filter the information by date and keep logs for a custom number of days, weeks, months or years. Administration tool: user management MailStore Server can be managed by an
